Ground-Based
Interferometers

LIGO (North America)

Virgo (Europe)

LIGO 6th Science Run
(2010) Range ~ 20-50 Mpc

"Advanced" LIGO+Virgo
(~2017) Range ~ 200-500 Mpc

Detection Rate ~ 1-100 yr⁻¹

Importance of EM Detection:

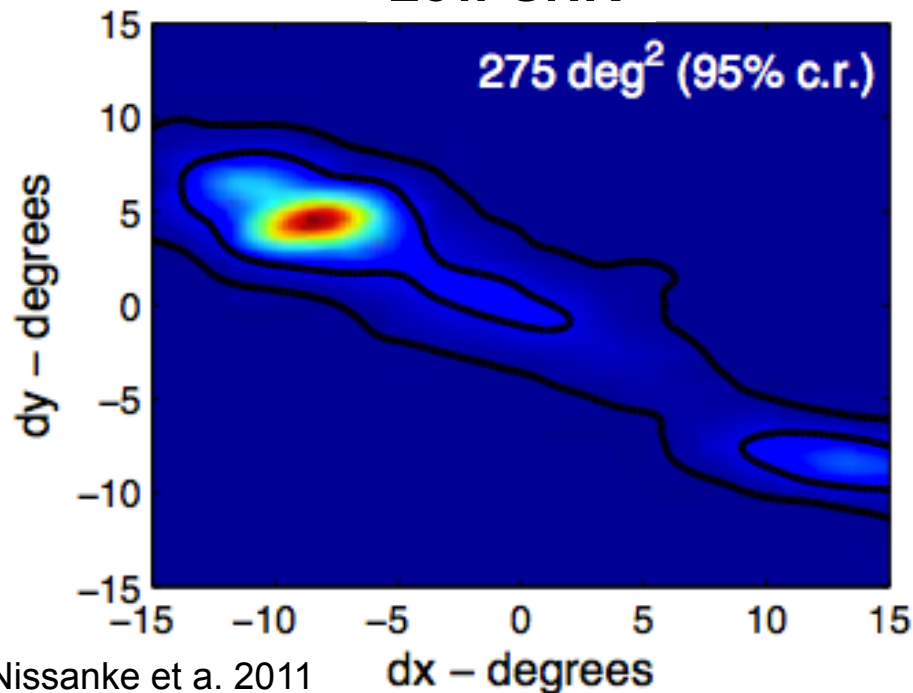

- ◆ Improve “confidence” in GW detection; dig deeper into GW data
- ◆ Independently constrain binary parameters
- ◆ Astrophysical context (e.g. host Galaxy & environment)
- ◆ Cosmology (e.g. H_0 , w); test strong-field GR; constrain neutron star EOS

Importance of EM Detection:

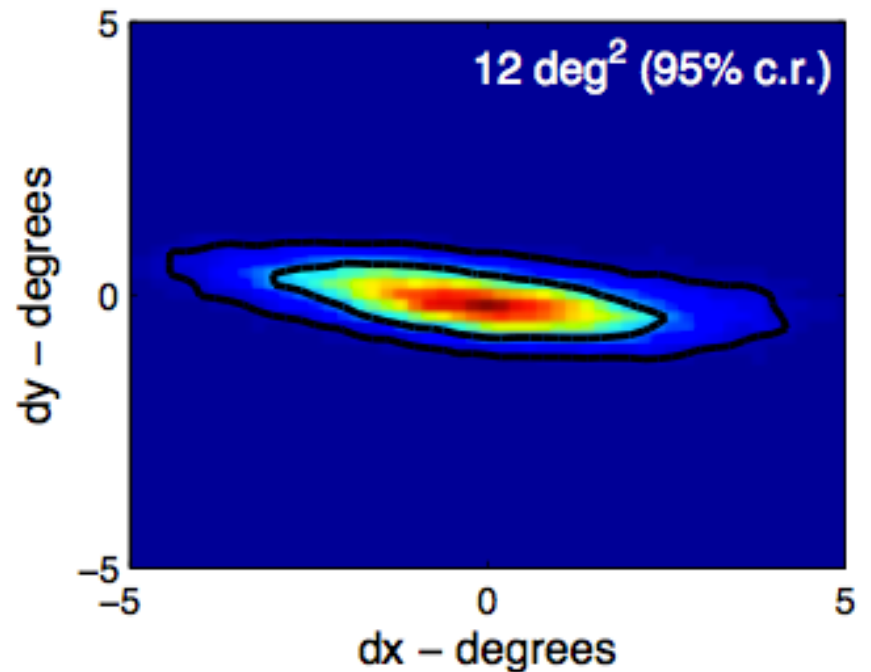

- ◆ Improve “confidence” in GW detection; dig deeper into GW data
- ◆ Independently constrain binary parameters
- ◆ Astrophysical context (e.g. host Galaxy & environment)
- ◆ Cosmology (e.g. H_0 , w); test strong-field GR; constrain neutron star EOS

Sky Error Regions $\sim 10\text{-}100 \text{ deg}^2$ (~ 2019)

Low SNR

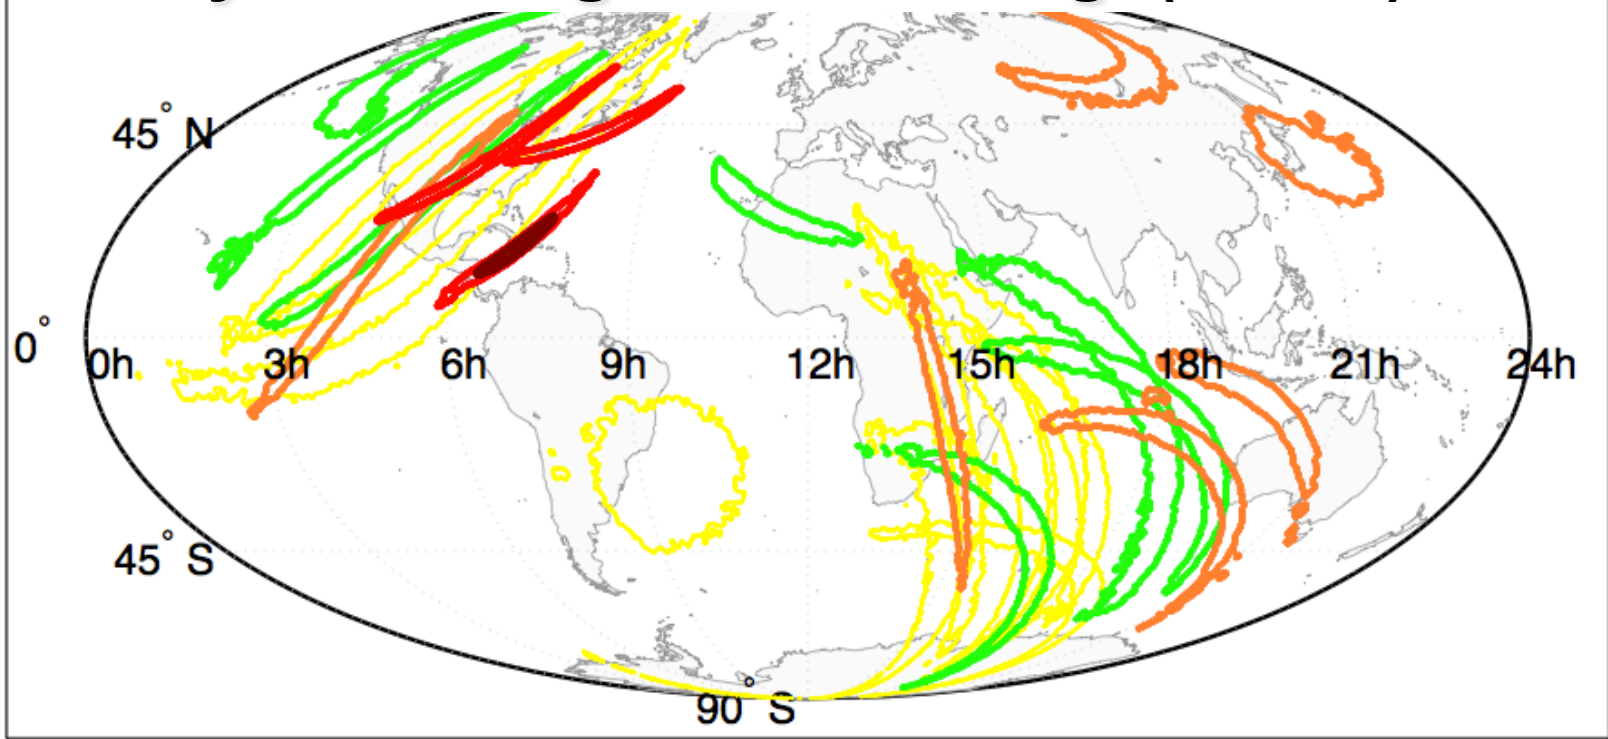

High SNR

Importance of EM Detection:

- ◆ Improve “confidence” in GW detection; dig deeper into GW data
- ◆ Independently constrain binary parameters
- ◆ Astrophysical context (e.g. host Galaxy & environment)
- ◆ Cosmology (e.g. H_0 , w); test strong-field GR; constrain neutron star EOS

Sky Error Regions $\sim 300 \text{ deg}^2$ (~ 2017)

Two Component Light Curve

Remnant Torus Evolution

(Fernandez & Metzger 2012, 2013; Fernandez et al., in prep)

- P-W potential with $M_{\text{BH}} = 3, 10 M_{\odot}$
- hydrodynamic α viscosity
- NSE recombination $2n+2p \Rightarrow {}^4\text{He}$
- run-time $\Delta t \sim 1000\text{-}3000 t_{\text{orb}}$
- neutrino self-irradiation: “light bulb”
+ optical depth corrections:

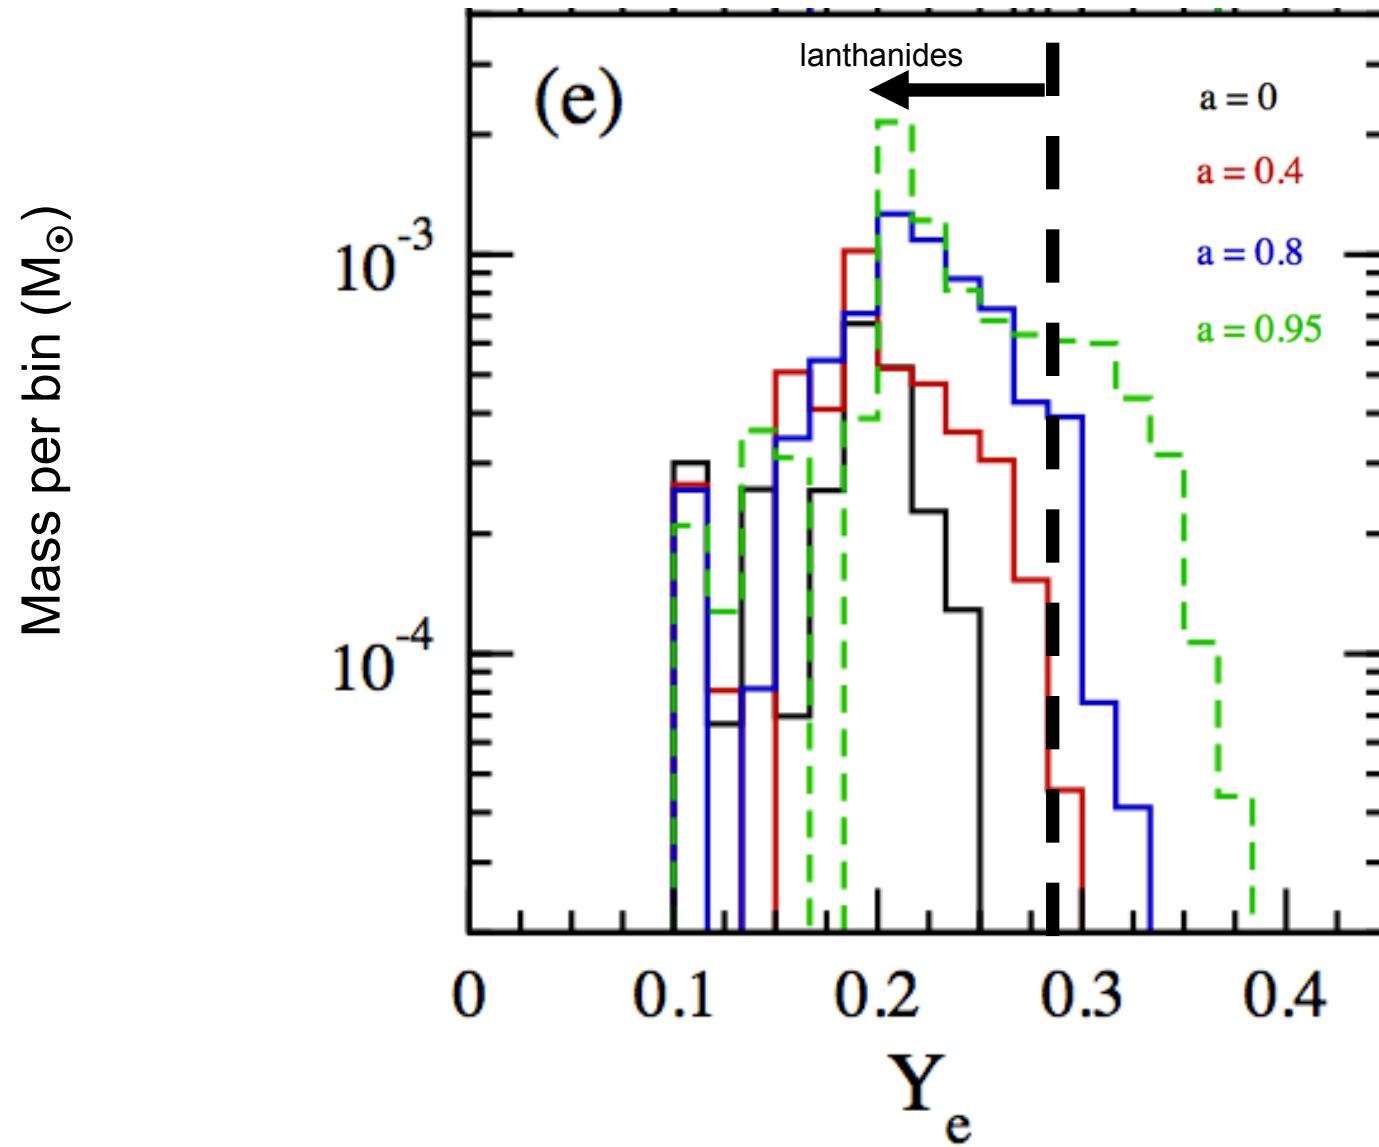

Fernandez & Metzger 2013
 Fernandez et al. 2015

outflow robust

$$M_{\text{ej}} \sim 0.05-0.2 M_t \quad V_{\text{ej}} \sim 0.1 c$$

Stable Merger Remnant?

(e.g. BDM+08; Ozel et al. 2010; Bucciantini et al. 2012; Zhang 13; Yu et al. 2013; Giacomazzo & Perna 13; ; Rezzolla & Kumar 15; Ciolfi & Siegel 15)

- Requires: low total mass binary, stiff EOS*, and/or mass loss during merger
 - *supported by recent discovery of $2M_{\odot}$ NS by Demorest et al. 2011
- Remnant rotating at centrifugal break-up limit, spin period $P \sim 1$ ms
- Magnetic field amplified by rotational energy + convection \Rightarrow “Magnetar” ?

$t = 8.34$ ms

Baryon Loading a Game Stopper?

e.g. Murguia-Berthier+14, Fryer+15

BDM+11

$$\Gamma_{\max} = \frac{L_P}{\dot{M}c^2}$$

$$\bar{f}_\Phi = R_{\text{ns}}/R_L \approx 0.4(R_{\text{ns}}/20 \text{ km})(P/\text{ms})^{-1}$$

$$\dot{M} = 2 \times 10^{-5} M_\odot \text{ s}^{-1} \frac{f_\Phi}{\bar{f}_\Phi} \left(\frac{L_\nu}{10^{52} \text{ erg s}^{-1}} \right)^{5/3} \left(\frac{\epsilon_\nu}{10 \text{ MeV}} \right)^{10/3}$$

Qian & Woosley 96

$$L_P = \left(\frac{f_\Phi}{\bar{f}_\Phi} \right)^2 \frac{\mu^2 \Omega^4}{c^3} \approx 3 \times 10^{51} \left(\frac{f_\Phi}{\bar{f}_\Phi} \right)^2 \left(\frac{B_d}{10^{15} \text{ G}} \right)^2 \left(\frac{P}{\text{ms}} \right)^{-4} \text{ erg s}^{-1}$$

$$\Gamma_{\max} = \frac{L_P}{\dot{M}c^2} \approx 100 \frac{f_\Phi}{\bar{f}_\Phi} \left(\frac{B_d}{10^{15} \text{ G}} \right)^2 \left(\frac{P}{\text{ms}} \right)^{-3} \left(\frac{L_\nu}{10^{52} \text{ erg s}^{-1}} \right)^{-5/3} \left(\frac{\epsilon_\nu}{10 \text{ MeV}} \right)^{-10/3}$$

Radio constraints on stable merger remnants

(BDM & Bower 2013)

- Rotational energy

$$E_{\text{rot}} = \frac{1}{2} I \Omega^2 \simeq 3 \times 10^{52} \text{ergs} \left(\frac{P}{1 \text{ ms}} \right)^{-2}$$

transferred to ISM via relativistic shock
⇒ bright radio emission

- Observed 7 short GRBs with VLA on timescales ~ 1 -3 years after burst

- NO DETECTIONS

⇒ stable remnant disfavored in 2 GRBs

- Additional JVLA observations **now** much more constraining

- New radio surveys (ASKAP, VLASS, SKA) will tightly constrain birth rate of stable NS merger remnants (BDM, Williams, Berger 15).

Timeline of Binary NS Mergers

1.	Chirp enters LIGO Bandpass	t (minus) \sim mins
2.	Precursors (X-ray, coherent radio burst)	t (minus) \sim few s
3.	Last Orbit, Plunge & Dynamical Ejecta	$t \sim$ ms
4.	BH Formation	\sim ms - ∞
5.	Accretion of Remnant Disk, Jet Formation (γ -rays)	\sim 0.1-1 s
6.	He-Recombination + Disk Evaporation \Rightarrow outflow Y_e depends on NS collapse time	\sim 0.3-3 s
7.	R-Process in Merger Ejecta	\sim few s
8.	Jet from Magnetar (X-rays)	\sim min (or longer)
9.	Neutron Precursor (Optical/UV, $L \sim 10^{41}$ erg s $^{-1}$)	\sim hours
10.	Kilonova \Rightarrow prompt BH formation $Y_e < 0.25$ (NIR, $L \sim 10^{41}$ erg s $^{-1}$) \Rightarrow delayed BH formation $Y_e > 0.25$ (Optical, $L \sim 10^{40-41}$ erg s $^{-1}$) \Rightarrow stable magnetar (Optical, $L \sim 10^{44}$ erg s $^{-1}$)	\sim week \sim day \sim day
11.	Ejecta ISM Interaction (Radio , much brighter if stable NS)	\sim years

UV (n-precursor) optical (disk wind) infrared (disk wind + dynamical)

Conclusions

- The first direct detection of gravitational waves will likely be a binary NS merger, within the next ~ 3 years. ***Identifying an EM counterpart will be essential to maximize the scientific impact of this discovery.***
- The most promising isotropic counterpart is an optical/IR transient (“kilonova”) powered by the radioactive decay of r-process nuclei.
- The radioactive heating of the ejecta is now well understood, but the photon opacity of r-process ejecta remains uncertain.
- The first kilonova was detected following the gamma-ray burst 130603B last June, confirming the association of mergers with short GRBs.
- Kilonova provide a direct probe of the formation of r-process nuclei, a long standing mysteries in nuclear astrophysics.
- The sensitive dependence of opacity on the ejecta composition (lanthanide fraction) implies that kilonova colors provide a sensitive probe of physical processes at work during the merger, such as the delay until black hole formation.
